MARCH. *I Month.*

The Sun, whose unexhausted Light
Does Life and Heat to Earth convey;
The Moon, who, Regent of the Night,
Shines with delegated Ray;
The Stars, which constant seem to Sight,
And Stars that regularly stray:
All these God's plastick Will from Nothing brought,
Assign'd their Stations, and their Courses taught.

On the 20th of this month, 1727, died the prince of astronomers and philosophers, sir *Isaac Newton*, aged 85 years: Who, as *Thomson* expresses it, *Trac'd the boundless works of God, from laws sublimely simple.*

What were his raptures then! how pure! how strong!
And what the triumphs of old Greece *and* Rome,
By his diminish'd, but the pride of boys
In some small fray victorious! when instead
Of shatter'd parcels of this earth usurp'd
By violence unmanly, and sore deeds
Of cruelty and blood; Nature *herself*
Stood all-subdu'd by him, and open laid
Her every latent glory to his view.

Mr. *Pope*'s epitaph on sir *Isaac Newton*, is justly admired for its conciseness, strength, boldness, and sublimity:

Nature and nature's laws lay hid in night;
God said, Let Newton be, *and all was light.*
